

Q3 Latency Review

Platform Reliability · 15 August 2026 · 4 pages

Summary

p95 latency fell 18% quarter over quarter, driven mainly by the read-path cache landing in July. Tail latency in eu-west remains the outlier and is tracked separately in RFC-114.

By region

Region	p50	p95	Change
us-east-1	42 ms	118 ms	−22%
us-west-2	39 ms	104 ms	−19%
eu-west-1	58 ms	247 ms	+6%
ap-south-1	61 ms	163 ms	−11%

Notes

1. The eu-west regression correlates with the connection-pool change shipped on 2 July, not with traffic growth.
2. Cold-start latency is excluded; see appendix B for the methodology.
